

SAFE NETIZENS

Z7S6U9

Learning Outcome

After this lesson, learners will be able to:

- Identify Cybercrime and its types
- Understand the implications of the various types of cyber threat
- Implement various safety precautions.
- Appreciate the use of various safety measures
- Understand the impact of online grooming and apply relevant safety measures.
- Understand the various forms of cyberbullying.
- Prevent themselves from Juice Jacking
- Understand various online transaction scams.
- Learn about precautionary measures to prevent card skimming and vishing.

2.1 INTRODUCTION TO CYBER CRIME AND ITS TYPES

The emergence of technology as the new knowledge powerhouse has brought about a dynamic change in the way we work, think, and perceive things. It has also led to new digital innovations providing opportunities to connect and learn and are affecting every sphere of life.

However, the exploration of these new vistas of knowledge and innovations require a strong element of caution. Thus, there is a need to sensitize ourselves to the vulnerabilities of the Internet and also be aware of the various types of Cybercrimes.

Cybercrime is defined as any unauthorized activity involving a computer, a digital device, or network.

Given below is a non-exhaustive list of common cyber-crimes.

Personal computers used without proper security measures could lead to the exploitation of the system for illegal activities. The system could be a target of various types of viruses, Trojans, Keyloggers and sometimes real hackers. This may result in data theft, data loss, stealing of credentials like login id, passwords etc. So, it is essential to protect and secure our Personal Computer before it is compromised.

So let us explore the various cyber threats, their effects and how to protect our devices from these cyber-crimes.

2.1.1 Phishing

Phishing is an attempt to obtain sensitive information such as usernames, passwords, and credit card details from users using fake websites which look identical to original websites.

Phishing scams prompt users to enter sensitive details at a fake webpage (phishing page) whose look and feel is quite similar to legitimate web pages. In most cases, the only difference is the URL.

Case Study

Mrs D'Souza is working as a software analyst in a reputed firm. One day she received an email from her bank asking to update her personal information pertaining to her bank account viz login details etc. on the pretext of upgrading the server of the bank. A link to her bank's website was also given in the mail. She simply clicked on the link and entered all her credentials. Next day she received a message from her bank saying that a sum of Rs 10,00,000 has been withdrawn from her account.

Actually, this was a fraud email and the bank website was not a real website but a look alike website of her bank which looks quite authentic and convincing. She got trapped and passed on her important credentials to cyber criminals. This led her to suffer financial loss.

TrustedBank™

Dear valued customer of TrustedBank,

We have recieved notice that you have recently attempted to withdraw the following amount from your checking account while in another country: $135.25.

If this information is not correct, someone unknown may have access to your account. As a safety measure, please visit our website via the link below to verify your personal information:

http://www.trustedbank.com/general/custverifyinfo.asp

Once you have done this, our fraud department will work to resolve this discrepency. We are happy you have chosen us to do business with.

Thank you,
TrustedBank

Member FDIC © 2005 TrustedBank, Inc.

Phishing is one of the most common threats. It is usually done through emails that contain dubious links. For example: You may receive an urgent email message from your bank(supposedly) claiming that you have made a withdrawal while on a foreign visit etc. This message intends to alarm you such that you are prompted to click on a dubious link provided by the perpetrator in the context of securing your account.

Once you click on that link your account / device may be compromised leading to loss of money/ information.

In recent times, many scams are being done using identities of Army Personnel.

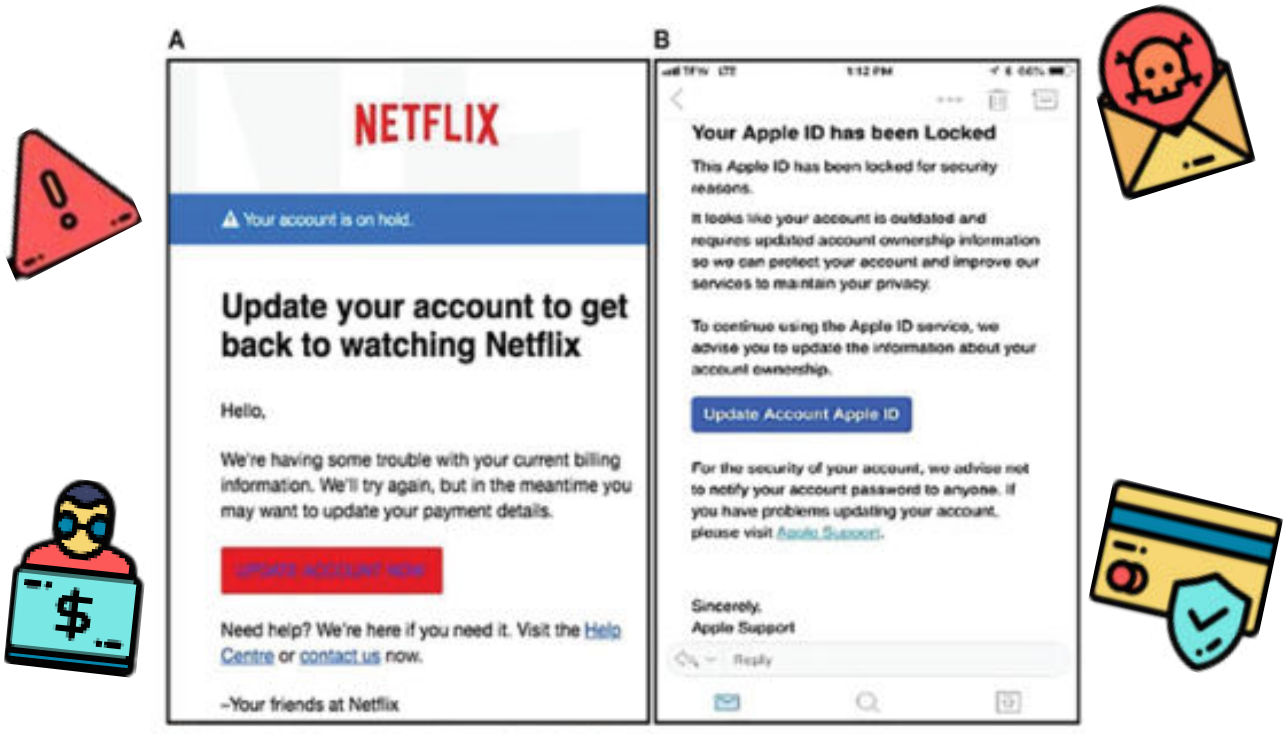

This scam is known as an Identity theft and can lead to serious consequences for the victims. The victims can be liable to pay monetary debts that they have not taken. The process can be long and daunting as they would be required to prove their identity several times.

A very common phishing bait is a reward message. It's very convenient for the preparators to float such messages through social media and target people.

In the example given here, you can see a WhatsApp forward promising a free Jio mobile phone plan.

In the example given below the user is asked to update the Netflix account shown in picture A. There is a link that is supposed to be used to update the account. Once the user clicks on the link, he/she may become a victim and undergo monetary loss. In the picture it can be clearly seen that the signatory is Your friends at Netflix. No company will send such important mail with this type of language.

In picture B, the user is prompted to update an Apple ID. There is no company logo. Also it asks the user to visit 'Apolo' Support for help. These can be treated as warning signs.

Impact of Phishing Attacks

Our personal information can be used to commit fraud and other crimes. This is also known as Identity Theft.

We can be a victim of Cyber Bullying and financial frauds.

We can experience Loss of data and contacts

Social and Professional embarrassments

Security threat for the victim and his family.

Tips for Spotting a Phishing Website

Always check the source of URL link before clicking, received by email/ social media

Don't click the link if the sender of the mail is unknown to you.

Use two-factor authentication (2FA) as it adds an extra verification layer when logging in to sensitive applications

Always look for green lock icon in the browser's address bar and stick to sites that begin with "HTTPS"

2.1.2 Cyber Bullying

A Cyber Bullying Victim is a person who has been experiencing harassment or an embarrassment from someone (known or unknown) using internet or digital technology. The act of repeatedly harassing a person digitally on online platforms is known as Cyber Bullying. It may include sexting, verbal or textual abuse. It can happen any time 365x24x7.

Main reasons of Cyberbullying may be

- frustration in life
- to cope-up with low self-esteem
- way to stay popular among peers
- feelings of loneliness
- for taking revenge etc.

Cyberbullying takes many forms. Common types of cyberbullying include:

- Harassment
- Exclusion
- Cyber Stalking
- Fraping
- Outing
- Dissing
- Fake Profiles
- Trickery
- Trolling
- Flaming
- Email Threats
- CatFishing

Harassment : Sending hurtful messages repeatedly to the targeted person.

Exclusion : Eliminating a target person from the online group or chat.

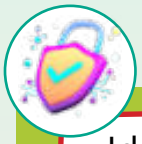

Cyber Stalking : When a person harasses or threatens another person using the internet.

Fraping : When someone uses a Facebook account of some other person without permission and deletes comments or pictures, or creates new and offensive comments and pictures pretending to be that person.

Dissing : Sending or posting harsh gossip about someone to harm their reputation.

Outing : The act of openly revealing sensitive or personal information about someone without their consent for the purposes of embarrassing or humiliating them.

Fake Profiles : Creating a fake social media profile using the details like name, address, mail id, photograph etc., of victims, without their knowledge to mislead the crowd.

Identity theft is different from fake profile, as identity theft is the act of stealing personal, private, or financial information, then indulging in fraudulent activity.

Trickery : Forcing someone to reveal their secrets, which are then shared online.

Trolling : Hampering the reputation by posting gossip.

Flaming : Using rude language in e-mails or chat sessions.

Email Threats : Sending Emails to threaten the target.

Cat Fishing : When someone uses images and information from other people's social media accounts to create a new identity online.

There are several fake profiles with fake names on the internet. When the aim is to trick or attract other people in order to deceive, abuse or humiliate them it is catfishing. It is mostly common on social networks or dating sites. When someone else's identity and personal data are stolen without the person›s permission, in order to commit financial fraud or other crimes it is called Identity theft.

Case Study

On New Year's Eve, Sneha invites her friends to a party. After cutting the cake, her friends put the cream and cherry on her face. Their intentions were to have fun, and one of her friends posted that picture publicly on Instagram.

A few days later, one offensive comment attracted other unpleasant statements making fun of her physical appearance, clothes, intelligence, etc. This broke her self-confidence, and she felt ashamed.

She started staying quiet, alone and became very sensitive. She would avoid & refuse to attend any social events, even the birthday parties of her friends. Even her teachers complained that she doesn't talk to anyone in the class & neither gets involved in any class activity. This was very unlikely of her according to them. Her parents were unaware of the actual trigger but later after the counselling session they filed a cyber bullying complaint.

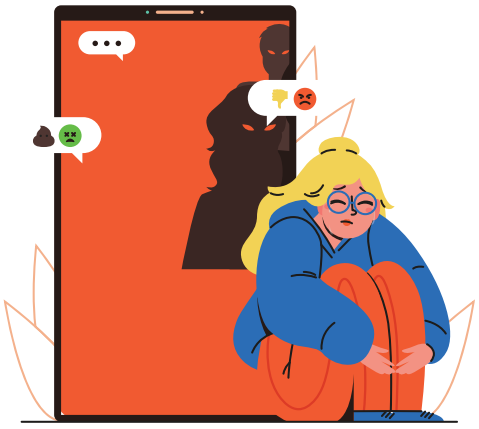

NEWS REPORT

Impact of cyber bullying

1. Depression, anger, nervousness and mood swings.
2. Loss of interest from studies/social life.
3. Suicidal Thoughts
4. Loss of Sound Sleep and appetite
5. Aggressiveness
6. Stressful lifestyle
7. Frequent complaints of stomach-ache, headache and other types of health issues.

Safety Measures

Prevention is better than Cure. The following are some safety precautions you can take to avoid being a cyber victim:

1. Educate yourself - Know about cyberbullying and talk to your family members.
2. Think before you post- Always rethink before you post anything online.

3. Review your photographs before posting online.
4. Protect your passwords and keep strong passwords.
5. Set up privacy control for your social media profiles and devices.
6. Google yourself - check your online presence.
7. Always log out your account from public computers.
8. Don't open messages from unknown people.
9. In case of a fraud, report to concerned authorities/ website / cyber cell.

2.1.3 Online Grooming

Online grooming involves a person (usually an adult) making contact with young people with the intention of persuading them into online or offline sexual activity. For this, they will use mobile and online technologies on social media. The groomer may use tactics like flattery or giving gifts to build a rapport or even threaten to gain control. Some of the signs of online child grooming may be secretive behaviour about what they are doing online, having older boyfriends or girlfriends, or inappropriate sexual behaviour as per their age. Online grooming is a criminal offence.

Case Study

Shanaya, a 12 year old girl is a single girl child. Her both parents are working and unable to give sufficient time to her. During her holidays, she used to feel lonely at home. One day, she got a new tablet from her father and from that day she used to watch movies, video call relatives, make new online friends and play online games.

After a few days, her mother felt a change in her behaviour. She became quiet, not even sharing her daily experience, not even trusting her mom, didn't want

to go out and even feared at night. Her mother noticed that she was not leaving her tablet for even a single minute.

One day her mother came early from her job and found that her daughter was crying in front of the tablet. Her mother counselled her. Then, Shanaya said that Amrita usually became my game partner while playing online and gradually she gained my trust and formed a strong friendship. We used to talk about family, friends and spend a lot of time in a chat room. We usually share our feelings of loneliness. She always complains that parents are responsible for their loneliness. I was also convinced with her and started giving wrong comments.

Few days back, she started blackmailing me and saying if I don't give her money she will tell everything to the police because she recorded my comments intentionally.

This case implies that the kids are groomed online by people who build a relationship, trust and emotional connection with a child or any young person so they can manipulate, exploit and abuse them.

Impact on Children

1. They may become more withdrawn, anxious, depressed or aggressive.
2. They may have difficulty in sleeping.
3. They are unable to concentrate or cope with school work.
4. Lack of confidence and loss of interest in daily activities.
5. They may have access to drugs and alcohol.

Safety Measures

Hide personal information	•Never share your personal or sensitive information like credit or debit card details, phone number, passwords etc.
Stop unnecessary chats	• Never be the part of any uncomfortable talks
Avoid in-person meetings with online friends	• Say no to face to face meetings
Talk to parent	•Make sure that you discuss everything with parents or guardians

Tip: Parents have to spend time with their kid. Ask your child about their daily routine. Talk about social media risks, share latest internet news. Set the timing to enjoy social media.

2.1.4 Juice Jacking

It is a cyberattack where a hacker uses the charging port of a public charging board to steal your personal data present in your phone. It results in the theft of your personal files and GPS data as well as financial information.

Case Study

Reeta was assigned a project in Gujarat. She was residing in Delhi and had to travel to Gujrat in the coming weekend. She was very excited for this new project. In her excitement she forgot to pack her phone charger. When she reached the airport, she felt the need to charge her phone but due to unavailability of her own charger she was forced to charge it through a public charging station present at the airport. She reached Gujrat safely and checked messages on her phone. To her surprise she found that there were certain transactions from her bank account which she didn't make. There was a sudden chill in her bones as she had lost around Rs. 25000. She immediately contacted her bank and froze all her bank accounts.

Safety Measures

1. Always keep your phone locked when charging it at public charging stations and ensure your device gets timely software and security updates.
2. You can also disable automatic data transfer through the Settings app on both Android and iOS smartphones.
3. Users can also get a device called a 'USB Data Blocker', which provides a protective barrier between your device and 'juice-jacking' hackers. It turns any USB port into a charge-only port by blocking all the data lines.

2.1.5 Threats Due to Keyloggers

Keylogger is a hardware device or a software program that secretly monitors or records all your keystrokes (on the keyboard). Since we mostly interact with the computer using a keyboard, keyloggers can track our credit card information, passwords, the websites we visit and other sensitive information.

Hardware keyloggers: These are physical devices that record every keystroke. These can be disguised in the computer cabling or in a USB adapter, making it hard for the victim to detect. The cybercriminal would need physical access to the device to install a hardware keylogger.

Software Keyloggers: This is a software that doesn't require physical access to a device. Users download software keyloggers onto the device intentionally or inadvertently along with malware.

Case Study

Rajesh always used to have the latest antivirus in his system. He was very careful with login credentials. One day he left his system open and unattended for an urgent meeting. Two days later, he received a message from his bank stating that a sum of Rs 20,000 had been debited from his account. He was surprised and shocked as besides taking all precautions how this could happen to him. Later after scrutiny, he came to know that he had a keylogger installed in his system due to which he became a victim and lost his money.

Impact

It is often used by hackers to steal passwords, credit card numbers and other confidential data.

Safety Measures

1. Use virtual keyboard* while logging into secure websites.
2. Use apps that encrypt your keystrokes.
3. Use a good antivirus.
4. Use anti loggers, programs that can detect a keylogger on your computer.
5. Do not open email attachments received from unknown sources.
6. Always scan attachments before opening.
7. Do not click on popup windows, close them through the Windows task bar.

---

* Virtual Keyboard is an online application. It uses a mouse to enter password or important information. It is available on all banking websites. Users must use this while entering sensitive information.

2.1.6 Threats Due to Spam Mail

Spam email, also known as junk email, is generally unsolicited bulk email which is trying to sell you something. It is a form of commercial advertising. Spam messages usually promote offers of weight loss programs, online degrees, free goods or 'prizes', lottery, cheap products etc.

Case Study

Rajat works as a manager in XYZ bank. One day he received an email saying that he had been chosen as one of the lucky winners in the email balloting system of XYZ lottery service as organised by the Asian lottery board. He was asked to claim his prize by emailing his name, address, and date of birth on the given email id.

This type of mail is spam mail and is used to steal user's credentials.

Some examples of Spamming include:

- Unsolicited commercial Emails sent in bulk.
- Emails from people you don't know.
- Counterfeit messages like the one in the example given above.
- Messages from known people whose accounts have been hacked.

Foreign Remittance Department,
6, San sad Marg, New Delhi - 110001.
Contact Email: rbi.claimsdept_in@dgoh.org

GENERAL MANAGER

Impact

1. It consumes a lot of bandwidth unnecessarily.
2. Users may get misled by the attractive advertisement of the products or services.
3. System may be attacked by Spyware.

Safety Measures

1. Always check the sender and recipient information of suspicious messages.
2. Do not respond to spam messages. If you receive a spam email, simply delete it. Do not respond, attempt to unsubscribe, or call any telephone number listed in the email. Most spammers verify receipt and log responses. The more you respond, the more spam you're likely to receive.
3. Make sure that you use the latest version of your web browser and that all of the latest Internet security patches have been applied.
4. Use spam filters and virus filters.
5. Use a firewall on your computer.

2.1.7 Threats due to Ransomware

Ransomware is a form of malicious software (or malware) that is designed to extort money from a victim. It encrypts data that is stored on the victim's disk and blocks normal access to the victim's system.

The only way to regain access to the files as claimed by ransomware is to pay a ransom.

The cost to regain access ranges from a few hundred dollars to thousands, payable to cyber criminals in cryptocurrency like Bitcoin.

Case Study

Ransomware is an ever-increasing threat worldwide, claiming a new victim every 10 seconds. One of the latest ransomwares named WannaCry is one of the most devastating ransomware attacks in history.

In the first half of 2022, there were an estimated 236.1 million ransomware attacks globally. Ransomware accounted for around 20% of all cyber-crimes in 2022.

One day, Rajesh entered his cabin and switched on his system. Instead of his computer booting up smoothly and showing his desktop, he was greeted with a scary-looking window featuring an image of a large padlock. He got a message that all files and data on his system have been locked and the hackers demanded $300 in order to release control of his files.

Threat

1. The attack forces the shutdown of systems leading to heavy losses to organisations.
2. Sometimes desperate people simply pay the ransom instead of looking into alternative options.

Safety Measures

1. Keep your operating system patched and up-to-date.
2. Don't install software or give it administrative privileges unless you know exactly what it is and what it does.
3. Install antivirus software, which detects malicious programs like ransomware as they arrive.
4. It is advisable to backup your files frequently and automatically.

2.1.8 Threats Due to External Storage Devices

USB drives, CD's etc. have made storing and transferring of data very simple and easy. Besides being useful they are also potential carriers of malware and hence can be a big security threat.

Case Study

Rajat and Mohit were working as project partners on a Science project. Rajat completed his part of work, stored it on pen drive and gave it to Mohit. Mohit without taking any safety precautions inserted the pen drive into his computer. Later he found that his computer had got infected by malware.

Impact

1. It could be a carrier of malware that might download additional malicious codes onto the device. This malware code could be used to steal sensitive or financial information of the victim and transfer the data to an external server.
2. Autorun is a feature in Windows that automatically runs an executable file in a drive when it is accessed. If this feature is enabled in your computer, any malware in the USB drive can get executed automatically the moment the drive is plugged into a computer.

Safety Measures

1. Never use an unknown USB drive on your computer. Even if you are using your friend's or colleague's flash drive, ensure that the device is not infected.
2. Use a reliable and multi-layered security solution for your computer.
3. Disable the autorun function in your computer.
4. Do not store information such as Aadhar number, credit card number, bank account details, passwords, etc., in your flash drives. However, if you should do it, then get all such data encrypted.

2.2 THREATS IN ONLINE TRANSACTIONS

Digital payments are immensely beneficial not only for the common citizen but also for the government. In India, the demand for contactless payments increased during the Covid-19 period, encouraging businesses to start accepting electronic payments.

Digital payments have a number of advantages, including:

- Less need to carry a lot of cash for big transactions
- Better expenditure tracking
- Ease of Payment

While digital payments offer many advantages, it is also necessary to be careful. With the increase in digital spending, payment-related fraud is also on the rise. Some of the common payment threats are

Card Skimming → Sharing Card Details → Vishing

2.2.1 Card Skimming

Skimming is an act of stealing information through the magnetic stripe on bank ATM/Debit/Credit cards. When confidential data from an ATM/Debit/Credit card is stolen by fraudsters by reading the magnetic black stripe present on the back side of the card, it is called skimming.

To steal data, a small device called 'card skimmer' is often installed at self-service terminals such as ATM Machines. The device scans the card details and stores its information. The criminals return later to collect the device and retrieve the stolen information. It is also possible to record the PIN using a tiny camera that is placed carefully.

Case Study

One fine morning when a Mumbai-based businessman Rohan was getting ready for work, he received an SMS informing him that Rs. 68,000 had been withdrawn from his account through an ATM in multiple transactions. Disgusted, he immediately went to the cyber police station to file a complaint of fraud.

The cyber police inquired about the most recent transaction made with that card. He told them that on 31st December, he went to a restaurant with his friends for a New Year's party and paid with his debit card via a swipe machine.

The matter was investigated by cyber police. They discovered that some of the fraudsters were in contact with waiters at the restaurant. The waiters' job was to steal card data by swiping customers' debit/credit cards on the skimming device and remembering the customer's four-digit PIN entered during payment. The fraudsters then used the data from the skimming device to clone the card and withdrew money from ATMs using the PIN.

Impact of card skimming

1. Card skimming can cause massive financial losses.
2. Fraudulent transactions have a negative impact on the victim's credit score.
3. If the bank freezes the account to prevent further fraudulent activity, the cyber victim will be unable to access his own account.

How to prevent Card Skimming

1. Look for an unusual damage to the card reader on any card swipe machine.
2. Look for any glue or adhesive marks on or near the card reader.
3. Hide PIN Pad while entering your PIN on any card swipe machine.
4. Keep an eye on your debit/credit card while giving it to others.
5. Avoid suspicious or unfamiliar card swipe machines or ATMs.
6. Inspect any swipe machine before swiping or inserting the card.

MEDIA REPORTS

THE TIMES OF INDIA

25+ ATM users duped of lakhs in 15 days, police stations yet to act

TNN | Sep 13, 2021, 11.43 AM IST

NAGPUR: Police stations of MIDC, Hingna, Wadi and adjoining ones were caught napping as citizens lost lakhs of rupees through ATM skimming in the last fortnight.

The victims lost money as their accounts started getting debited due to repeated withdrawals from ATMs in Bihar, Jharkhand and Madhya Pradesh. CCTV footage in the city captured an ATM fraudster using a four-wheeler.

THE TIMES OF INDIA

Mumbai: Bulgarian ran skimming scam from his room at Andheri hotel

TNN | Dec 14, 2021, 09.51 AM IST

MUMBAI: The city crime branch have claimed to have busted a major credit/debit cards skimming racket with the arrest of a Bulgarian national from a three star hotel in Andheri on Sunday.

The crime branch unit 7 on Sunday arrested Fergier Vensislav Donchor (45) who is one of the key members of the skimmer gang.

Sources said that while they have arrested Fergier, they are looking for one more Bulgarian national involved in the racket.

THE TIMES OF INDIA

Mumbai: 23 people duped of lakhs in Goregaon ATM fraud

TNN | Dec 5, 2021, 06.05 AM IST

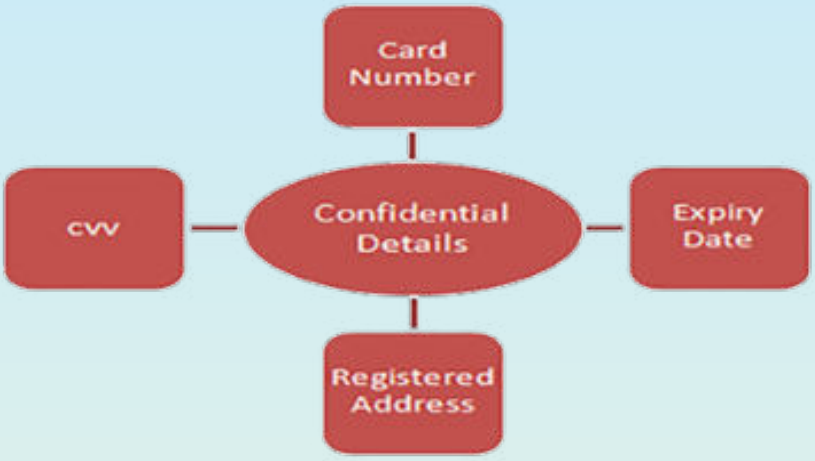

MUMBAI: In a span of three hours on November 27, 22 customers of a nationalised bank who had their accounts in the Goregaon (west) branch were duped of a total of Rs2.24 lakh by a fraudster who withdrew money from the ATM without them sharing any details.

Two days later one more person, a senior administrative officer with BEST training school, Sudash Sawant, approached the police with a similar plaint. In the case of a BEST official, he lost Rs 2.7 lakh in 29 fraudulent withdrawals between November 11 and November 22 but realised it later.

2.2.2 Sharing Card Details

Every Credit/Debit card contains some important details that should never be shared. For Example

- **Credit Card Number:** It is usually a 16-digit number printed on the card.
- **Card Verification Value (CVV):** It is a 3-digit number printed usually on the back side of the card.
- **Expiry Date:** Month and year of card expiry.
- **Registered Address:** The address at which the card is issued.

Once this crucial information is disclosed or compromised, a fraudster can use it to complete a card-not-present transaction (i.e. an online transaction). A card-not-present transaction is one in which the cardholder makes a payment without physically using his/her card.

Case Study

Ravi, a Bangalore-based IT professional, was always careful about online payment fraud and took all necessary precautions to avoid it. Once, he received a phone call from one of his good friends, Rakesh.

Rakesh requested his ABC Bank credit card information so that he can receive an additional 10% discount on an e-commerce website. Assuming that any online transaction always requires an OTP, Ravi shared his credit card number, CVV, and expiry date via WhatsApp chat. Rakesh then purchased a mobile phone from an e-commerce website and thanked Ravi for his assistance.

After six months, Rakesh's phone was stolen. The thief gained access to Rakesh's WhatsApp account and obtained the card information shared by Ravi. He used the card information to make purchases on a foreign e-commerce website. Ravi learned about the purchases after receiving the SMS.

Ravi was unaware that many international transactions do not require an OTP, and as a result, despite his vigilance, he became a victim of cyber fraud. He immediately blocked the card after receiving the SMS to prevent further unauthorised transactions.

Impact of sharing card details

1. Sharing card details can result in significant financial loss.
2. If the victim also shares personal information such as address, PAN card number, and Aadhaar card number, etc., it can result in identity theft.
3. Fraudulent transactions have a negative impact on the victim's credit score.

Prevention

1. Never share your credit/debit card information.
2. Never reveal your OTP to anyone.

Never share your bank debit card details, PIN number - this woman lost Rs 50,000 over food bill fraud

This woman lost Rs 50,000 due to an order she placed in a fraud case. She was tricked into it through a simple modus operandi by cybercriminals. Time and again bank account holders have been warned that they must never share their bank debit card details and PIN number with anyone for any reason at all.

Thieves only need your credit card data, not your card to defraud you

ET CONTRIBUTORS - Last Updated: Nov 25, 2019, 10:44 AM IST

Synopsis
Fraudsters are creative and constantly come up with ways to embezzle personal information.

By Venkat Krishnapur

I was recently at a family gathering, usually a melting pot for various conversations ranging from cooking, health, children's education to finances, with people often soliciting advice on something they're going through. Being a security evangelist, I receive my fair share of queries on computer viruses, hacking, and so on. Just then, I met an old friend who had no idea how his credit card could have been used in another corner of the world and exclaimed "My credit card was billed

2.2.3 Vishing

Vishing is the fraudulent activity of making phone calls pretending to be from reputed business firms in order to convince individuals to disclose personal information, such as bank account information or credit card data.

Case Study

Raghav, a Lucknow-based businessman, received a call on his landline phone from someone who introduced himself as an employee of XYZ Bank's IT team. The caller spoke professionally and knew all of Raghav's basic information, such as his name, address, occupation, and so on.

He informed Raghav that his team had recently witnessed a cyber attack on the bank. The team worked tirelessly to stop the attack, but still, some customers' sensitive information was compromised. He told Raghav that his account information had also been compromised. The caller also told him that the bank has set up a "personal and secure" alternate bank account for all these people, and that he should transfer all the money from his existing account to that account as soon as possible.

Based on the conversation so far, Raghav was confident that the call was from the bank. As a result, he became concerned and transferred all of the funds as instructed by the caller.

Later, he discovered that the call was not from that bank, but from cyber criminals, as he lost the entire amount (approximately Rs 2.5 lakh) from his account.

Impact of vishing

1. Vishing can result in significant financial losses.
2. If the victim also shares personal information such as address, PAN card number, and Aadhaar card number, it can lead to identity theft.
3. Fraudulent transactions have a negative impact on the victim's credit score.

Prevention

1. Never reveal personal or banking information over the phone.
2. Banks will never ask you to share sensitive information over the phone, and you should never share your OTP with anyone.

3. If you receive an OTP on your phone without transacting, it was most likely triggered by a fraudster using your personal information. Do not give the OTP to anyone over the phone. Contact your bank right away to notify them that your information may have been compromised.
4. Stay alert and attentive during phone calls.
5. Beware of phone calls from unknown numbers.

Vishing and smishing: The rise of social engineering fraud

2.3 STAY SAFE ON SOCIAL MEDIA

Every year, millions of people become victims of social media account thefts, have their personal information stolen, or become victims of online scams as a result of users' open data sharing and frequent usage of weak password protection. Many of them have no idea how to be secure when using these social media platforms.

Learning how to stay safe on social media is especially important with the increasing use of digital payment systems and apps, phone verification, and touch technology. These are the six tips that keep you safe on social media.
